It's a shame to see how XM is being attacked by the NAB for something they could've been a part of from day one. The only thing anybody can say negatively about satellite radio is that it is taking away listeners and profits from regular on-air listeners daily and the reasons have all been laid out on the table for everyone to see. FM broadcast stations have failed to upgrade the quality of their services, and output ranges, and basically they can't cater to an individual listener like satellite radio can. Traffic and weather are every persons necessity when they are in their cars. Where else can we turn to, to check traffic reports or flash flood warnings? What if you are in a poor broadcast reception area or you live out in the country or in the mountains? Satellite radio has brought music and radio programming to people who were unable to have such things before. As a dedicated XM listener, I will stand behind the service that has changed the world of radio. Who would want to have to switch from XM to FM just for a second to hear the weather or traffic? And another thing, every major city has pretty much the same playlist format, and you hear the same songs day in and day out pretty much every hour. Why not let us decide what we want, and not let broadcast radio tell us what we like? It's time for a change.
